At the end of 2006, 2.7 billion cell phone subscribers existed world-wide, and sales of smart phones—phones capable of taking advantage of sophisticated data services—have increased 75% in the same period †.

The availability of powerful, always connected data devices opens new opportunities to reach your customers. Providing the ability for customers to check seating or appointment availability, obtain driving directions, and get the latest on sales and discount opportunities are some of the examples of how mobile application development can improve your services offerings.

Cozy Networks offers development services for Web and Java enabled cell phones and mobile devices and the iPhone using Flash, Java CLDC and MIDP, XHTML, and other mobile Web technologies.
